EXPERIMENT-3

NAME : Sheik Noordeen ROLL NO : 240701494

1.COMMAND LINE INTERFACE:

PYTHON CODE:

```
 def register():
    username = input("Enter new username: ")
    password = input("Enter new password: ")

    with open("users.txt", "a") as f:
        f.write(username + "," + password + "\n")

    print("Registration successful!")

def login():
    username = input("Enter username: ")
    password = input("Enter password: ")

    with open("users.txt", "r") as f:
        users = f.readlines()

    for user in users:
        stored_user, stored_pass = user.strip().split(",")
        if username == stored_user and password == stored_pass:
            print("Login successful!")
            return

    print("Invalid username or password!")
```

```
print("===== LOGIN SYSTEM (CUI) =====")

while True:
    print("\n1. Register")
    print("2. Login")
    print("3. Exit")

    choice = input("Choose option: ")

    if choice == "1":
        register()
    elif choice == "2":
        login()
    elif choice == "3":
        break
    else:
        print("Invalid choice")
```

OUTPUT:

```
PS D:\UI> & D:/UI/.venv/Scripts/python.exe d:/UI/cui.py
PS D:\UI> & D:/UI/.venv/Scripts/python.exe d:/UI/cui.py
===== LOGIN SYSTEM (CUI) =====

1. Register
2. Login
3. Exit
Choose option: 1
Enter new username: SK
Enter new password: 2007
Registration successful!
```

2.GRAPHICAL USER INTERFACE:

PYTHON CODE:

```
 import tkinter as tk

def register():
    username = entry_user.get()
    password = entry_pass.get()

    with open("users.txt", "a") as f:
        f.write(username + "," + password + "\n")

    label_result.config(text="Registered!")

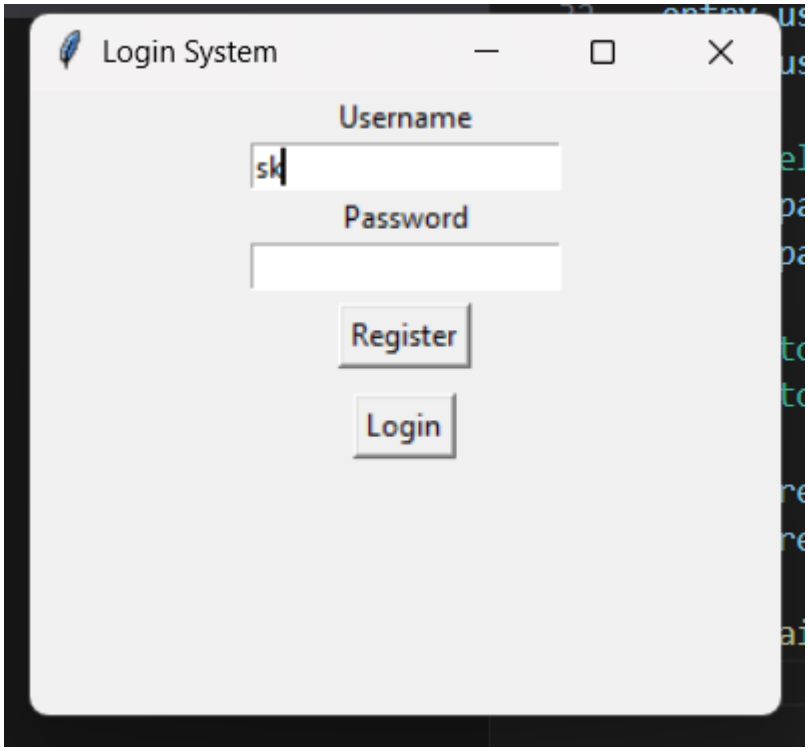
def login():
    username = entry_user.get()
    password = entry_pass.get()

    with open("users.txt", "r") as f:
        users = f.readlines()

    for user in users:
        stored_user, stored_pass = user.strip().split(",")
        if username == stored_user and password == stored_pass:
            label_result.config(text="Login Success!")
            return
    label_result.config(text="Login Failed!")
root = tk.Tk()
root.title("Login System")
root.geometry("300x250")
tk.Label(root, text="Username").pack()
```

```
entry_user = tk.Entry(root)
entry_user.pack()
tk.Label(root, text="Password").pack()
entry_pass = tk.Entry(root, show="*")
entry_pass.pack()
tk.Button(root, text="Register", command=register).pack(pady=5)
tk.Button(root, text="Login", command=login).pack(pady=5)
label_result = tk.Label(root, text="")
label_result.pack()
root.mainloop()
```

OUTPUT:



3.VOICE USERINTERFACE:

PYTHON CODE:

```
import speech_recognition as sr
import pyttsx3
engine = pyttsx3.init()
recognizer = sr.Recognizer()
def speak(text):
    engine.say(text)
    engine.runAndWait()
def listen():
    with sr.Microphone() as source:
        audio = recognizer.listen(source)
        return recognizer.recognize_google(audio)
speak("Say your username")
username = listen()
speak("Say your password")
password = listen()
print("Username:", username)
print("Password:", password)
speak("Login process completed")
```

OUTPUT:

```
Traceback (most recent call last):
  File "d:\UI\vui.py", line 1, in <module>
    import speech_recognition as sr
